

This is a bold, high-impact choice. Jesko Jets is famous for its "Scrollytelling" architecture—where the user doesn't just scroll down a page, but scrolls through a 3D narrative.

For a Growth Manager, this is brilliant because "Growth" is a journey (up and to the right). You can replace the literal "Jet" with a visual metaphor for momentum, effectively turning your portfolio into a demonstration of how you drive progress. Here is the blueprint to building a Jesko Jets-style portfolio adapted for a Growth Manager.

1. Deconstructing the "Jesko Jets" Aesthetic

To replicate this feel, your site needs three specific technical pillars:

- * Cinematic Scrollytelling: The scroll bar acts as a playback head. As the user scrolls, the camera moves through a 3D scene.
- * The "Hero" Asset: Jesko uses a high-fidelity Private Jet. You need a central 3D object that anchors the screen (e.g., a

futuristic compass, an abstract growing geometric structure, or a glass engine).

* Atmospheric Depth: Use fog, soft lighting, and floating particles to make the 3D space feel vast, not flat.

2. The "Growth Manager" Adaptation
You must translate "Aviation Luxury" into "Growth Authority".

| Jesko Feature | Your Portfolio Version |

|---|---|

| The Jet (Hero Object) | The Growth Engine: An abstract, crystalline 3D structure that evolves or gets more complex as the user scrolls (representing scaling a business). |

| Flight Path (The Journey) | The Timeline: Instead of flying over clouds, the camera glides past floating "milestones" (e.g., "200% YoY Growth," "\$5M ARR"). |

| "Book a Flight" CTA | "Scale With Me" CTA: Keep this persistent in the corner, just like their booking button. |

| Cockpit/Tech View | The "Stack" View: A section where the camera zooms into the

"engine" to reveal your tools (HubSpot, Google Analytics, SQL, Python) floating as 3D icons. |

3. The Tech Stack (How to Build It)

You have two paths depending on your coding comfort.

Option A: The "No-Code" High-Fidelity Route (Recommended for Speed)

- * Platform: [Webflow](https://webflow.com/) (for the site structure and interactions).

- * 3D Engine: Spline (specifically for the 3D model).

- * Why: Spline integrates natively with Webflow. You can model a 3D object in Spline, set up "States" (e.g., State 1: Front view, State 2: Side view), and link these states to the Webflow scroll bar.

- * Interaction: Webflow Interactions 2.0. You set a trigger: "While Page is Scrolling" -> "Play Spline Animation."

Option B: The Custom Dev Route (Maximum Performance)

- * Framework: React or Next.js.
- * 3D Library: Three.js with React Three Fiber (R3F).
- * The Trick: Use a loaded .glTF model (compressed using Draco) for your central object.
- * Animation: GSAP (GreenSock) ScrollTrigger.
- * Why: GSAP is the industry standard for the "pinned" scroll effect Jesko uses. You pin the <Canvas> to the background and scrub through the animation timeline based on window.scrollY.

4. Specific Design Moves to Steal

- * The "Pin-and-Fade" Typography: Notice how Jesko's text doesn't scroll with the jet; it fades in and out while the jet stays centered.
- * Implementation: Create a <div> container with position: sticky or fixed for your 3D canvas. The text sections should scroll over it with a high z-index.
- * Smooth Damping (The "Weight"): The jet

doesn't stop instantly when you stop scrolling; it drifts slightly.

- * Implementation: In GSAP or Spline, add damping or scrub: 1 (1 second delay). This adds that "heavy," luxurious feel.

- * Dark Mode Only: High-end 3D visuals pop best on black/deep navy backgrounds. Use a hex code like #0a0a0a rather than pure black to reduce eye strain.

5. Content Strategy for the Scroll

Don't just show visuals; tell your growth story linearly.

- * Screen 1 (Load): "The Engine of Growth." Your 3D object spins slowly.

- * Scroll 10%: The camera zooms into the object. Text: "Strategy is Detail." (Show your audit process).

- * Scroll 40%: The object accelerates forward. Text: "Velocity & Execution." (Show your experiment tempo).

- * Scroll 80%: The object transforms/expands. Text: "Results at Scale." (Show your revenue/user graphs floating in 3D space).

* Scroll 100%: The object lands/stops. Final CTA: "Ready to Launch?"

Growth Manager 3D Scrollytelling Portfolio — Build Specification

Objective

Build a high-performance, cinematic portfolio website using 3D scrollytelling inspired by Jesko Jets. The site should visually represent growth as a journey, using a central evolving 3D object and scroll-driven storytelling.

Core Concept

This is not a static website. It is an interactive narrative experience where:

Scroll = timeline progression

3D object = growth engine

Motion = business momentum

Sections = milestones of impact

Design Principles

1. Cinematic Scrollytelling

Scroll acts as a playback controller

Camera moves through a 3D environment

Smooth transitions between sections (no

abrupt jumps)

2. Hero Object ("Growth Engine")

Central persistent 3D object

Abstract, futuristic, crystalline or mechanical

Evolves as user scrolls:

Simple → Complex

Static → Dynamic

Small → Expansive

3. Atmospheric Depth

Use:

Fog

Soft directional lighting

Floating particles

Avoid flat backgrounds

4. Dark Mode UI

Background: #0a0a0a or deep navy

High contrast typography

Minimal color palette (accent = electric blue / neon green)

Site Architecture

Section 1: Hero (0–10%)

3D object slowly rotating

Text: "The Engine of Growth"

Subtext: Your positioning statement

Section 2: Strategy (10–40%)

Camera zooms into object

Show internal structure / layers

Text: "Strategy is Detail"

Content:

Audit frameworks

Funnel breakdowns

Section 3: Execution (40–80%)

Object accelerates / moves forward

Add motion blur / energy effects

Text: "Velocity & Execution"

Content:

Experiments

A/B testing

Iteration cycles

Section 4: Results (80–100%)

Object expands / transforms

Surround with floating metrics:

"200% YoY Growth"

"\$5M ARR"

Text: "Results at Scale"

Section 5: CTA (End)

Object stabilizes / lands

Persistent CTA button:

"Scale With Me"

Technical Implementation

Option A: No-Code (Fastest)

Platform: Webflow

3D Tool: Spline

Integration:

Embed Spline scene

Link scroll position to animation states

Use Webflow Interactions:

Trigger: While scrolling

Action: Control animation progress

Option B: Custom Development

(Recommended for Performance)

Stack:

Framework: Next.js (React)

3D: Three.js + React Three Fiber (R3F)

Animation: GSAP + ScrollTrigger

Key Techniques:

Load optimized .glTF model (Draco compressed)

Use <Canvas> as fixed/pinned background

Sync animation timeline with scroll

Example Logic:

```
ScrollTrigger.create({  
  trigger: section,  
  start: "top top",  
  end: "bottom bottom",  
  scrub: 1,  
  onUpdate: (self) => {
```

```
    animation.progress(self.progress);  
  }  
});
```

Interaction Patterns

1. Pin-and-Fade Text

3D canvas stays fixed

Text fades in/out over scroll

Use opacity + transform transitions

2. Smooth Damping (Weight Effect)

Add slight delay to motion

Makes object feel heavy and premium

3. Persistent CTA

Fixed button (top-right)

Always visible

Subtle hover animation

Required Skills

Design

Visual storytelling

Motion design thinking

UI/UX for immersive experiences

Frontend Development

React / Next.js

Component architecture

Performance optimization

3D Development

Three.js fundamentals

React Three Fiber

Lighting, materials, camera control

Animation

GSAP ScrollTrigger

Timeline control

Easing and damping

Optimization

Lazy loading assets

Model compression (Draco)

FPS monitoring

Performance Targets

Load time < 3s

Stable 60 FPS on desktop

Graceful fallback for mobile (simplified version)

Bonus Features (Optional)

Interactive hover states on 3D object

Sound design (subtle ambient audio)

Dynamic data-driven metrics

WebGL shader effects

Final Deliverable

A visually stunning, high-performance portfolio that:

Demonstrates growth expertise through interaction

Feels like a product, not a resume

Leaves a memorable impression within 10 seconds

Guiding Principle

"Don't explain growth. Make the user feel it."
